

The default Weld tags in AcornPipe have a shape that can vary by weld type and contains a very short tag, usually with one to two letters or numbers as shown.

Sometimes, particularly on pipeline work, much longer weld tags are needed. As of version 8-719, longer tags can be accommodated as follows. From the Start window, select Edit/Custom Weld Boxes on FAB drawings.

This brings up a dialog with five different options for the text to appear in the box.

If you use any text content other than just the weld tag, you will likely need to select the weld box shape as Custom Rectangle in order to accommodate it. You can also change the size of the text and the color of the box. Note that these settings affect only the current job.

The effect of the above settings is shown on the following page.

To use these same settings on another job, copy the file CustomWeldBoxFAB.txt to the other job folder.
